Peer Group Discussion: *our clinical case…*

- An 8-year-old girl presented with a complaint of dull aching pain in abdomen for 3–4 weeks.
- On examination, the vitals were stable; secondary sexual characteristics were not well developed.
- On abdominal examination, a well-defined lump, smooth and mobile, was felt corresponding to 16–18 weeks of gestation. The lump was firm in consistency and was very mobile.
- The patient was taken for surgery. On opening the abdomen, the uterus was very small in size, right ovary was normal, and a left ovarian cyst 8 cm in size with smooth surface was found.

Conclusions…

Figure 1-1. Concept mapping: Types of epithelia

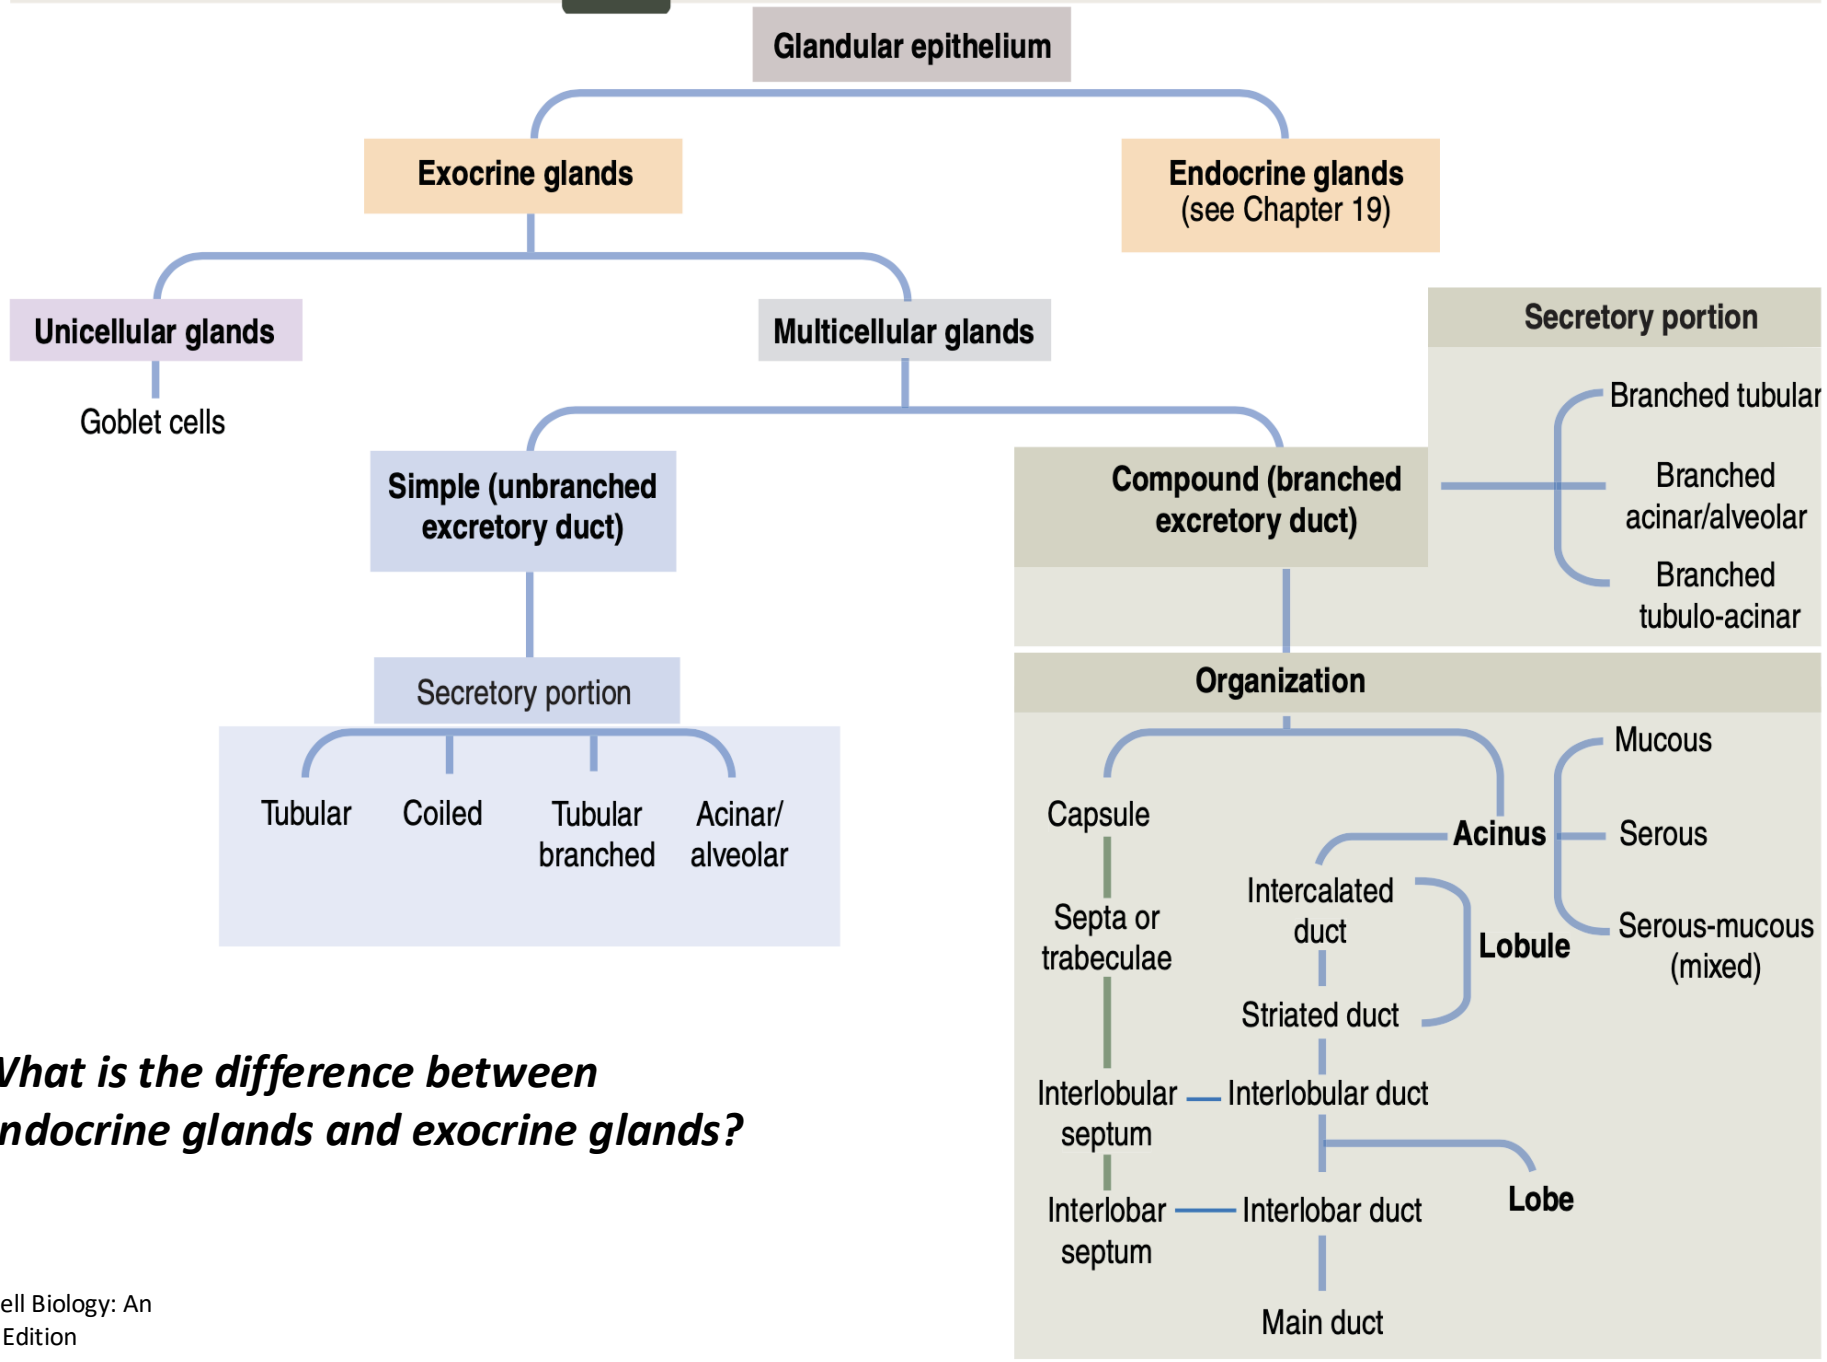

Define the terms indicated by 1, 2, 3, 4, 5

List the similarities and differences in structure, function & location of the tissues indicated by 6, 7 , 8, 9, 10, 11, 12, 13

Adapted from: Histology and Cell Biology: An Introduction to Pathology, 5th Edition

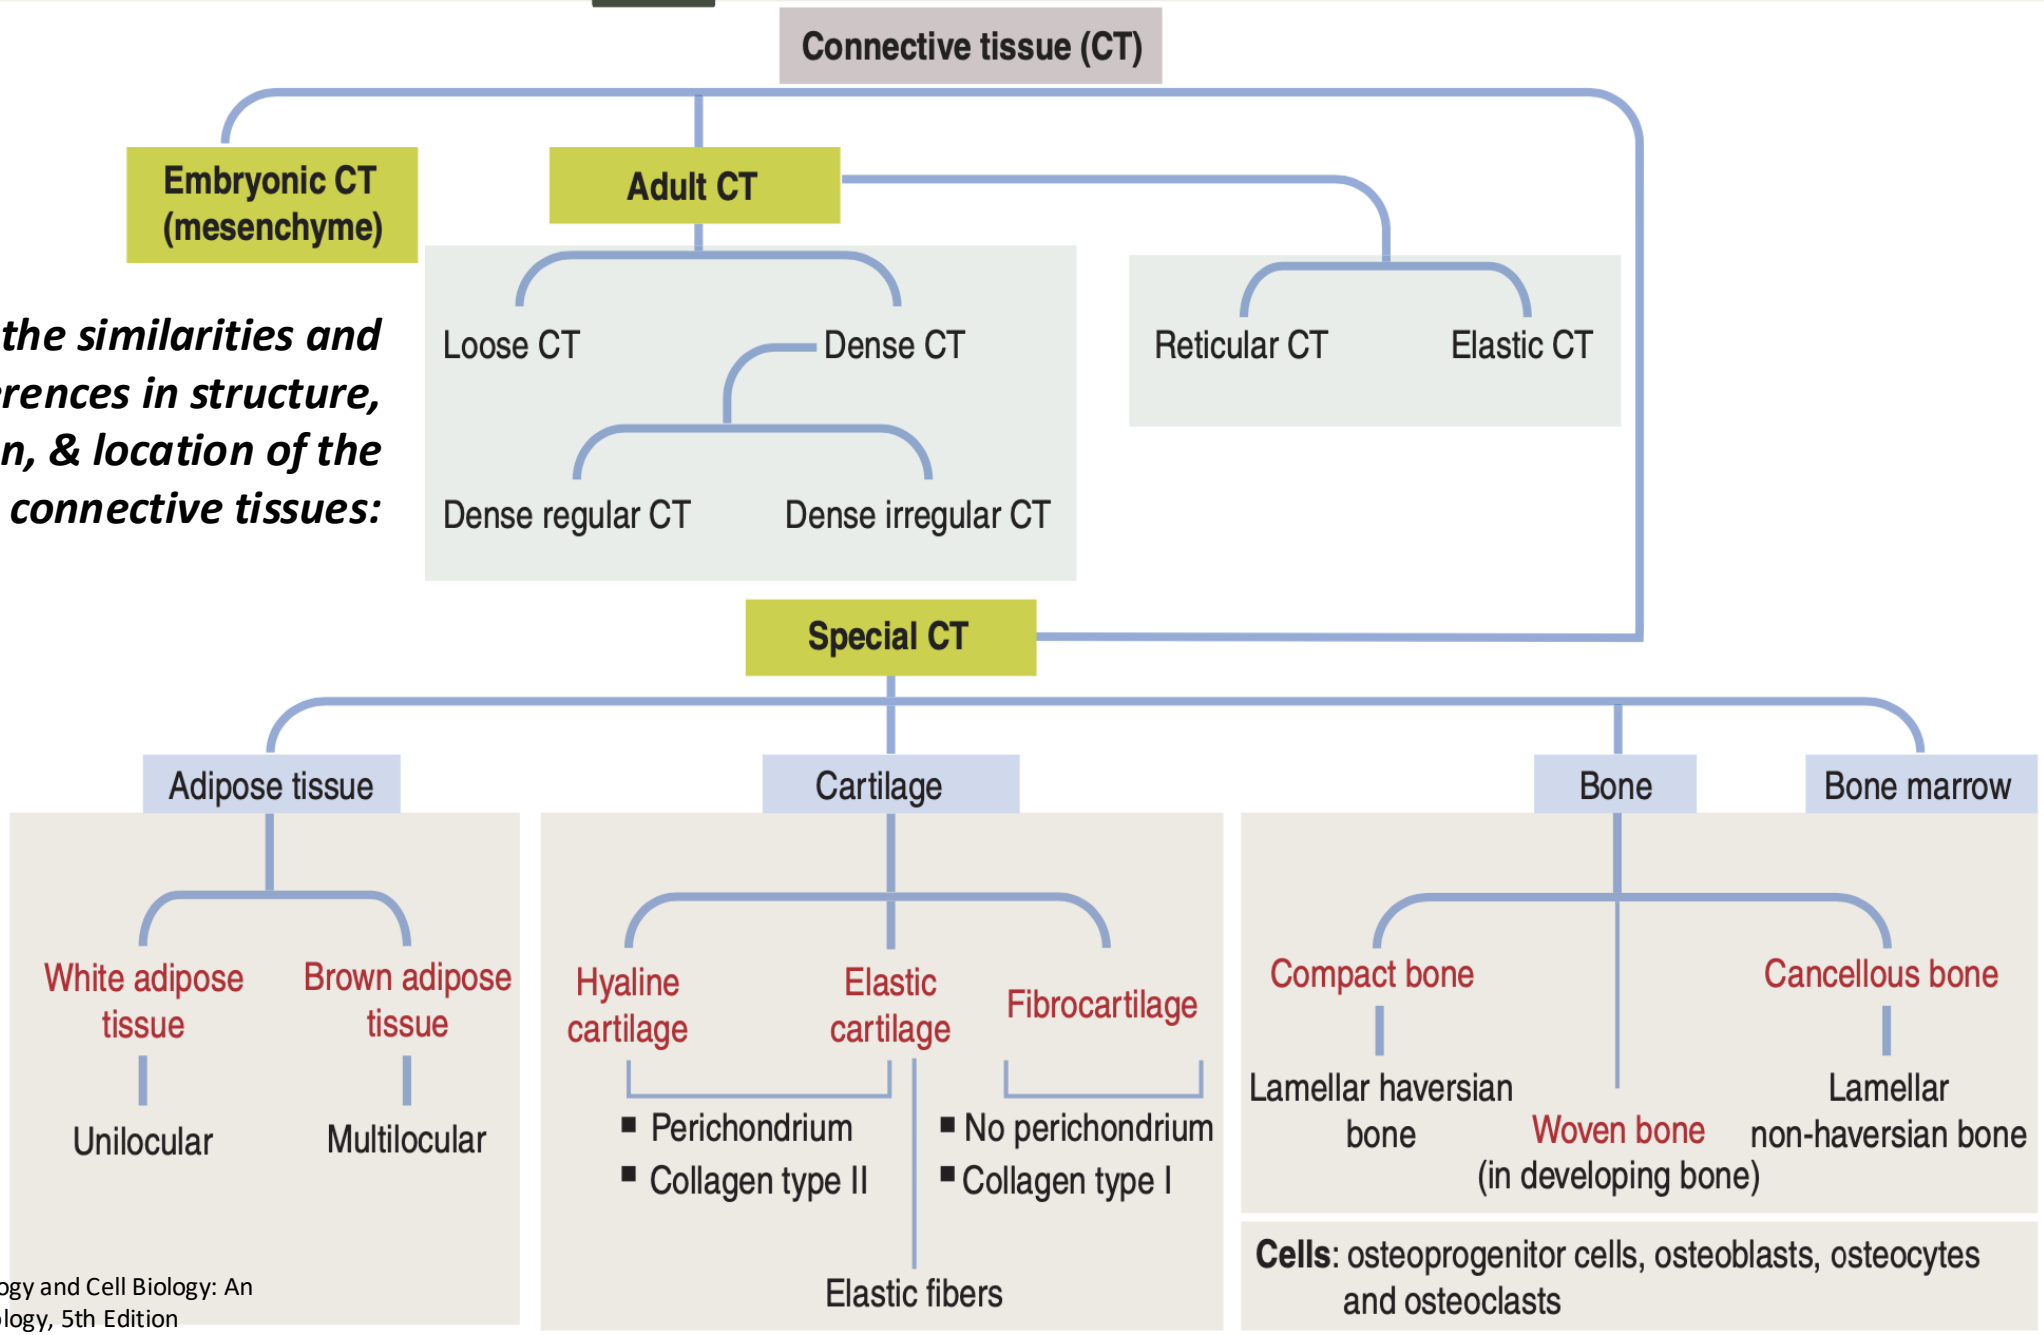

Concept mapping | **Epithelial Glands**

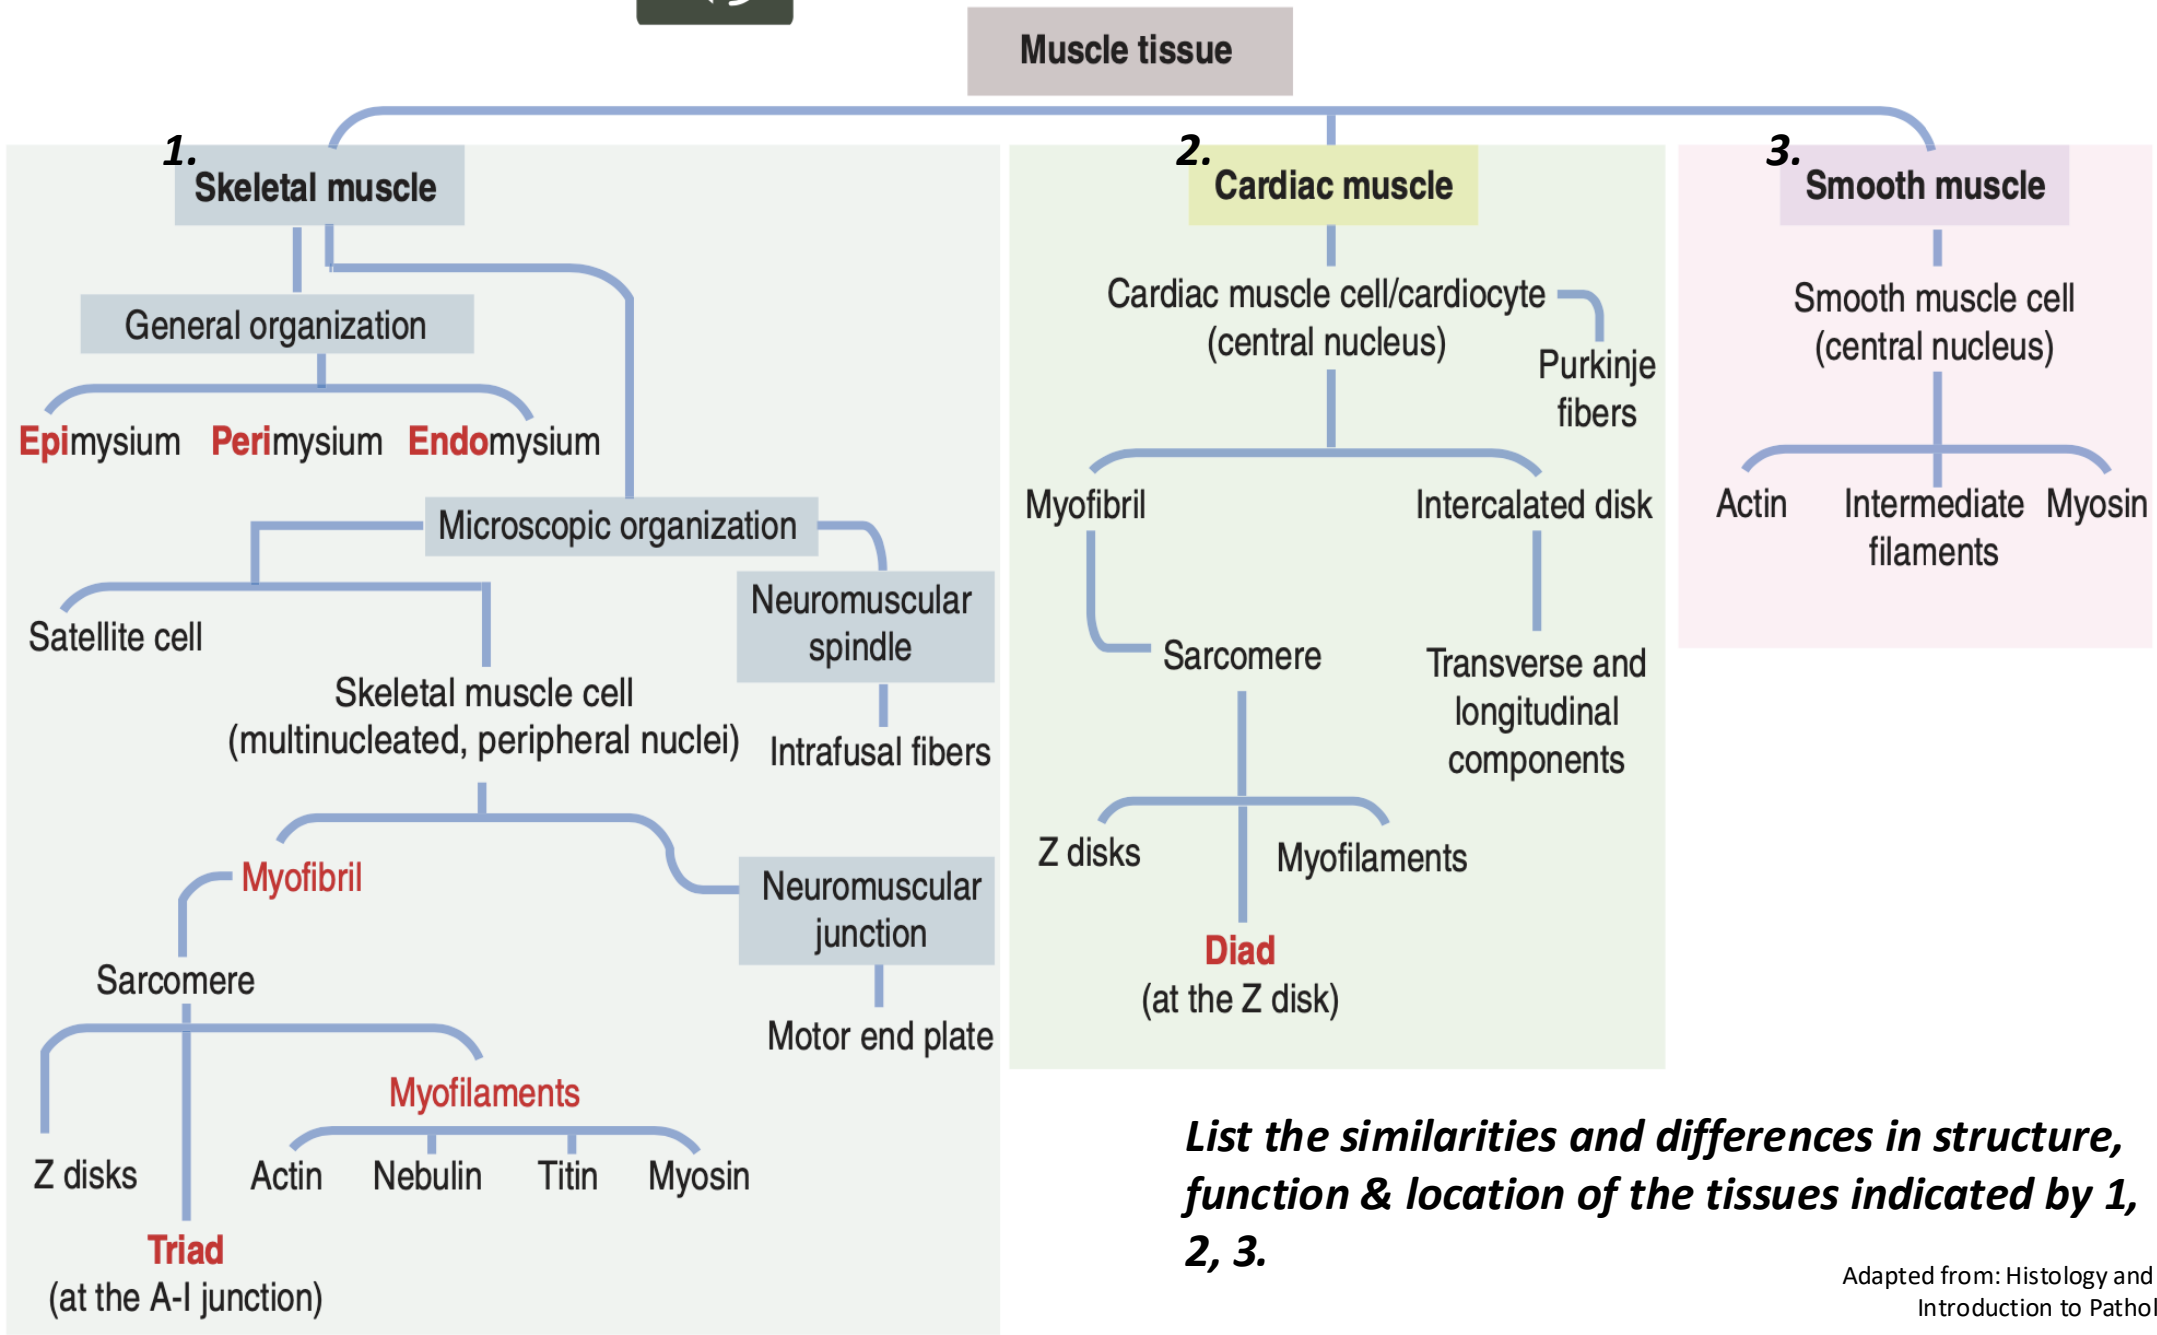

What is the difference between endocrine glands and exocrine glands?

Adapted from: Histology and Cell Biology: An Introduction to Pathology, 5th Edition

List the similarities and differences in structure, function, & location of the connective tissues:

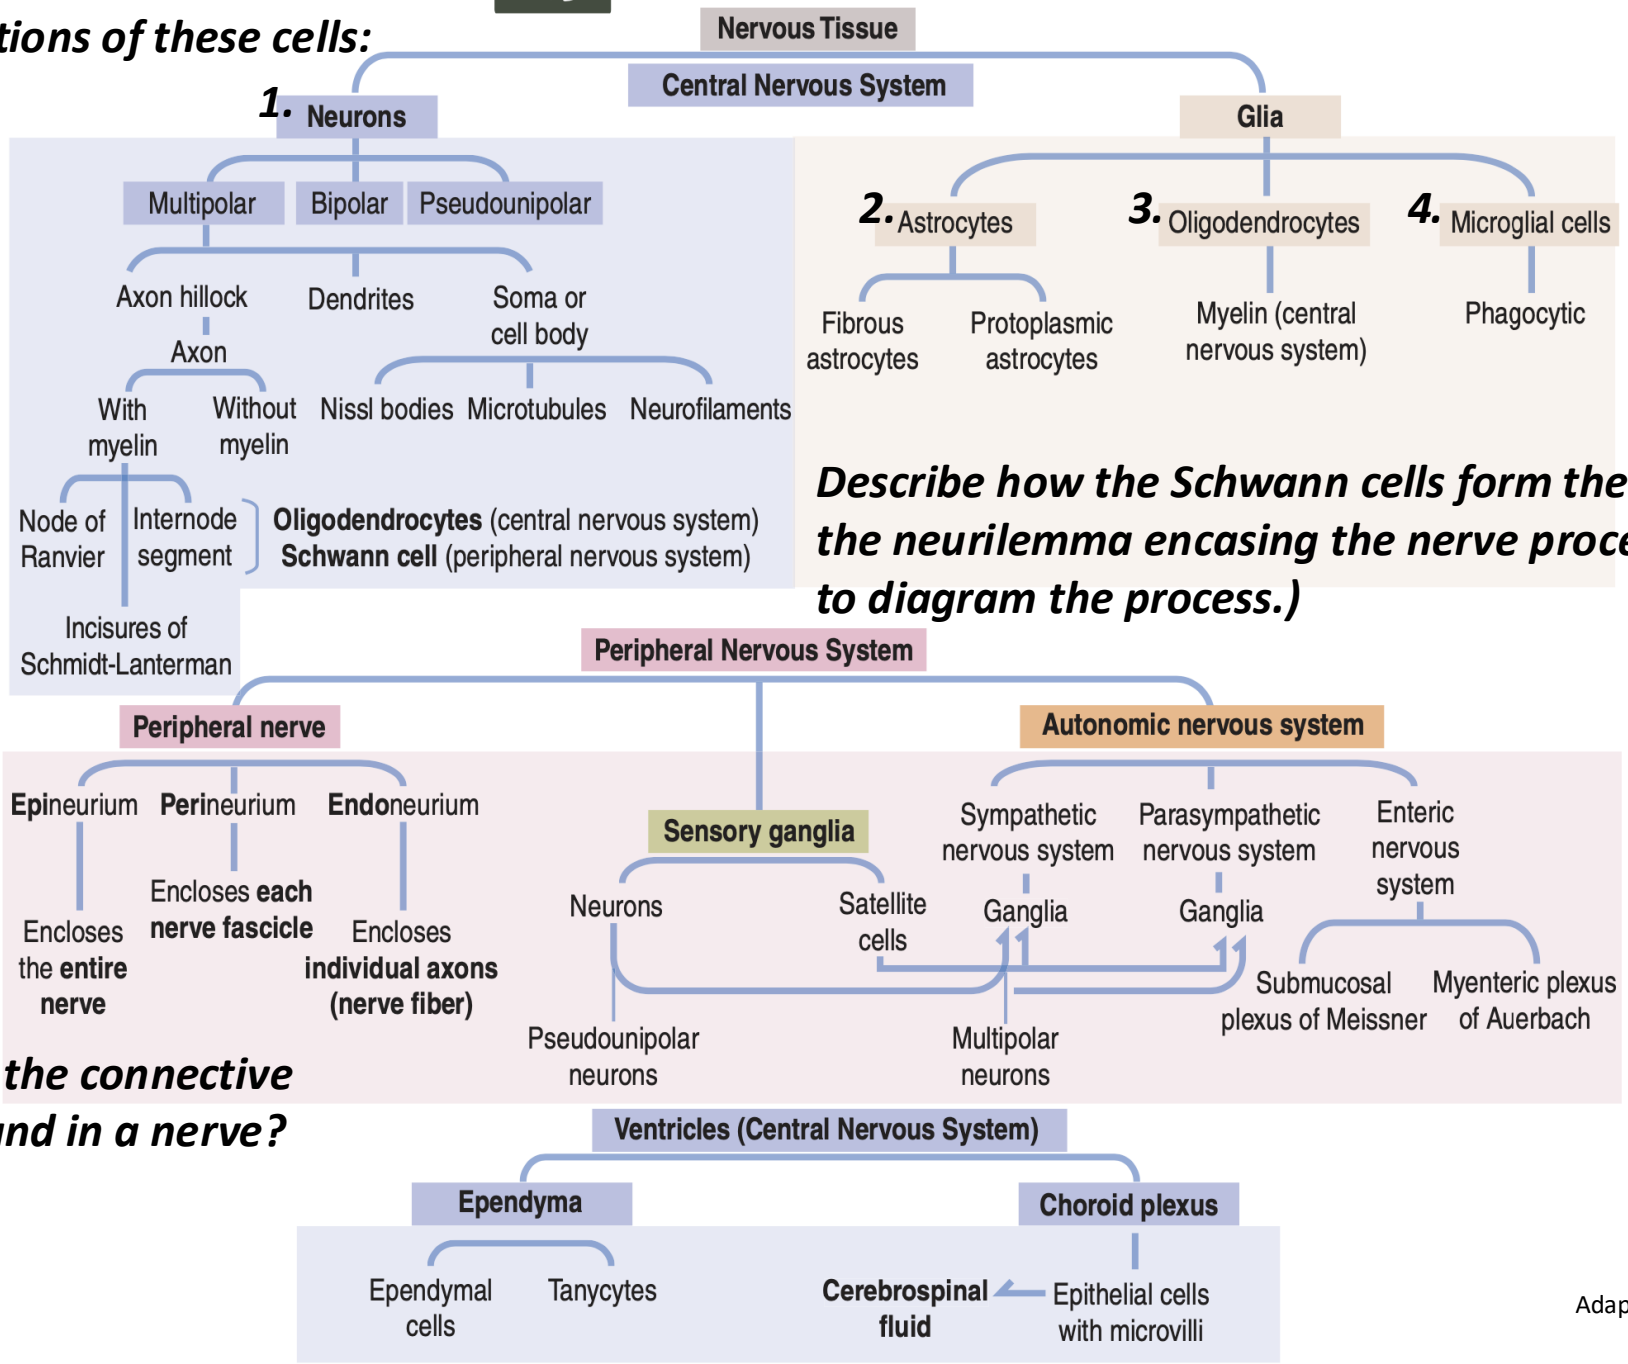

Adapted from: Histology and Cell Biology: An Introduction to Pathology, 5th Edition

List the similarities and differences in structure, function & location of the tissues indicated by 1, 2, 3.

Adapted from: Histology and Cell Biology: An Introduction to Pathology, 5th Edition

List at least two functions of these cells:

Describe how the Schwann cells form the myelin sheath and the neurilemma encasing the nerve processes. (You may want to diagram the process.)

What is the value of the connective tissue wrappings found in a nerve?
